

WHERE DO THE
TRAPEZIUMS GO?

Kanasu, Zo and Sahir are friends

One day, Kanasu, Sahir and Zo sit to study geometry together.

Kanasu, did you like
yesterday's Maths class?

Pictures help me understand
the topic better!

Zo, let us start working on the problem we got for homework?

Yes! Kanasu?

Yes!

HOMEWORK

Where do the trapeziums go, in this diagram?

Quadrilaterals

Parallelograms

This was easy. I just checked the definition in the text book.

A trapezium is a quadrilateral with **exactly** one pair of sides parallel.

Where do the trapeziums go, in this diagram?

Quadrilaterals

Parallelograms

According to Kanasu's definition, where would you put the trapeziums in this diagram? Why?

Where do the trapeziums go, in this diagram?

Quadrilaterals

I'm going to put the trapeziums here as my book says they are quadrilaterals with **exactly** one pair of sides parallel.

I have a different definition.

Tell us?

I don't agree with you, Kanasu. My teacher in my last school in Badapur said that "A trapezium is a quadrilateral with **at least** one pair of sides parallel."

Where do the trapeziums go, in this diagram?

Quadrilaterals

Parallelograms

According to this definition, where would you put the trapeziums in this diagram? Why?

My teacher said a trapezium is a quadrilateral with **at least** one pair of sides parallel. So this is how I see it!

Where do the trapeziums go, in this diagram?

Quadrilaterals

I don't agree with you

I went to the computer lab and looked it up on the internet.
The website I checked says "a trapezium is a quadrilateral
that may or may not have any parallel sides!"

According to this definition, where would you
put the trapeziums in this diagram? Why?

Clearly, this means a trapezium is just another name for a quadrilateral. So this is how it has to be.

Where do the trapeziums go, in this diagram?

Trapeziums
~~Quadrilaterals~~

Parallelograms

These are three different perspectives!

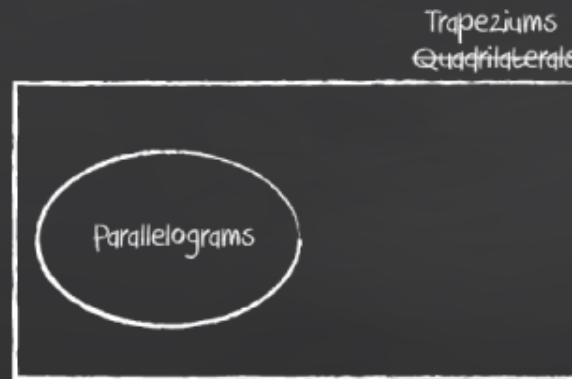

Where do the trapeziums go, in this diagram?

Kanasu's solution

Zo's solution

Sahir's solution

The three of them start arguing...

I'm right.

No I am

Both of you aren't.
I am.

???

Do you think it's possible for more than one of them to be right? Can a term be defined in more ways than one?

Discuss.

How could the three friends resolve their differences?

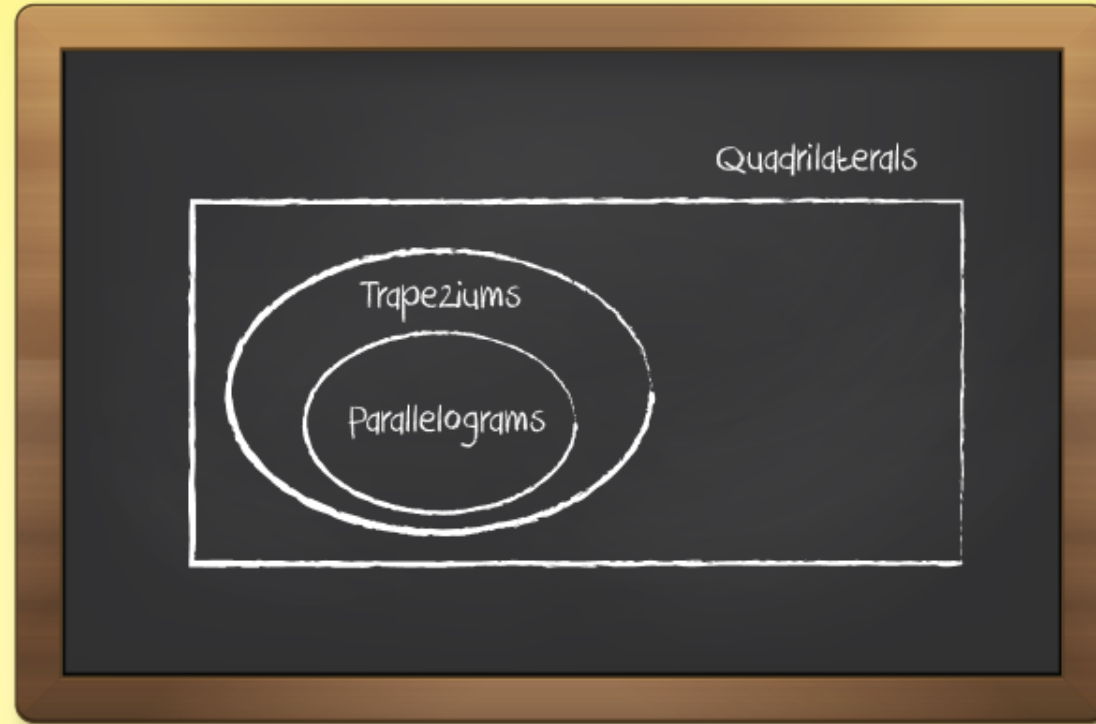

Give your suggestion on how the story could end.

Extension Tasks

According to Kanasu's definition of a trapezium, which of the following is TRUE:

- A. all trapeziums are parallelograms
- B. all parallelograms are trapeziums
- C. some trapeziums are parallelograms
- D. no trapezium is a parallelogram

According to Zo's definition of a trapezium, which of the following is TRUE:

- A. all trapeziums are parallelograms
- B. all parallelograms are trapeziums
- C. some trapeziums are parallelograms
- D. no trapezium is a parallelogram
